ProfileBook - Sprint 1 Capstone Report

Great Learning Wipro Pre Skilling Training

Submitted by: Venkata Sai Rehan

University: SRM AP University

1. Project Overview

ProfileBook is a web based social networking platform where users can interact, share posts, communicate through messages, and report inappropriate behaviour. The system supports two roles: User and Administrator. Users can register, login, create posts, like and comment on posts, search users, and send messages. Administrators manage users, review reports, and approve posts.

2. Software Development Model

The project was developed using the Agile Software Development Model. Development was divided into sprints. Sprint 1 focused on database design, backend setup, use case preparation, and static frontend implementation. After completing Sprint 1 successfully, Admin Dashboard and User Dashboard were implemented as the beginning of Sprint 2.

3. Technology Stack

Layer	Technology
Frontend	Angular
Backend	ASP.NET Core Web API (.NET 8)
Database	SQL Server
ORM	Entity Framework Core
Architecture	REST API
Version Control	GitHub

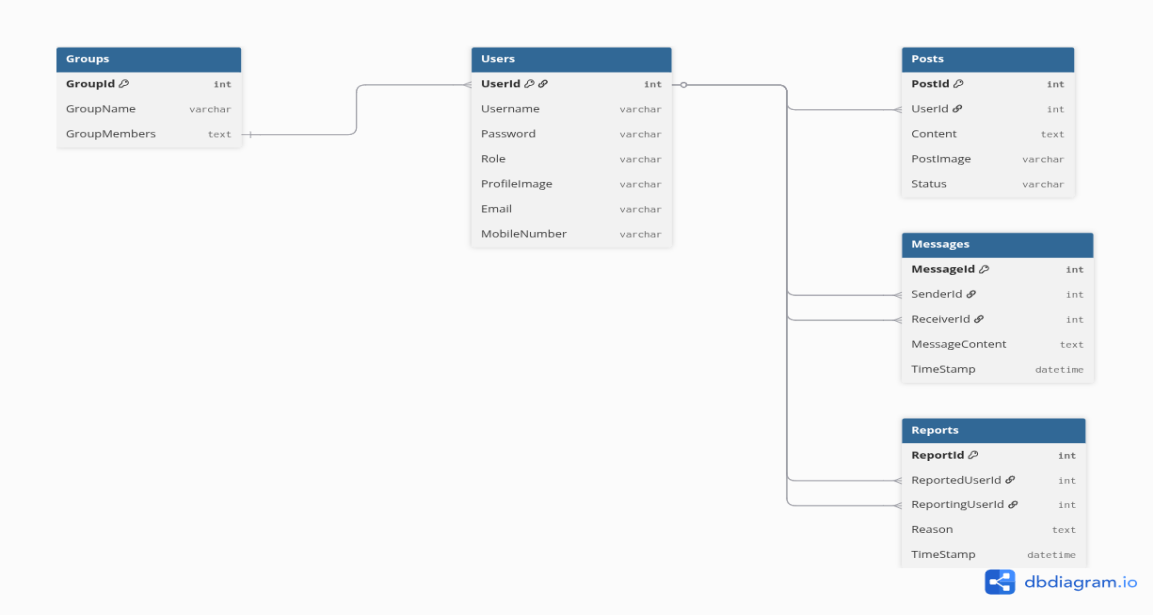
4. Sprint 1 Implementation

- CRUD operations implemented for Login and Signup.
- Admin account must be created using SQL Query for security.
- Database schema designed and ER diagram created.
- Entity Framework Core used as ORM.
- Controllers implemented: UserController, PostController, MessageController, ReportController.
- Clean project folder structure implemented.
- Static Angular UI pages completed: Welcome Page, Login Page, Signup Page.
- Backend APIs tested using Swagger.

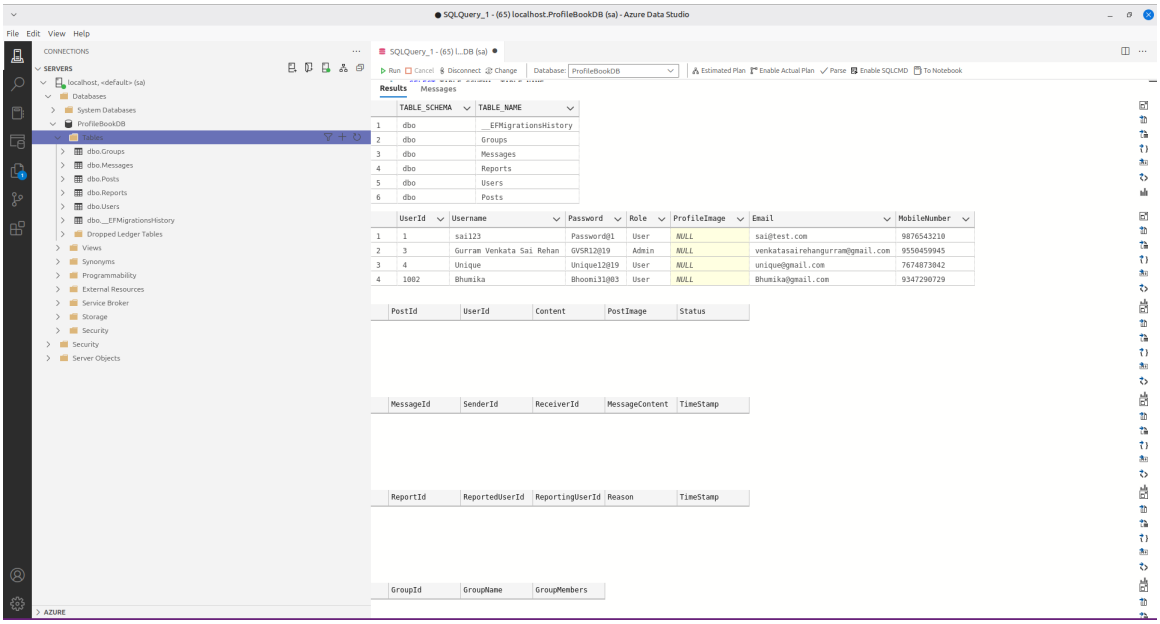
5. Database Schema Design

Table	Attributes
Users	UserId, Username, Password, Role, ProfileImage
Posts	PostId, UserId, Content, PostImage, Status
Messages	MessageId, SenderId, ReceiverId, MessageContent, TimeStamp
Reports	ReportId, ReportedUserId, ReportingUserId, Reason, TimeStamp
Groups	GroupId, GroupName, GroupMembers

Entity Relationship Diagram



Database Tables Snapshot



6. Use Case and Testing

Use cases were created using PlantUML and testing was performed using Swagger as instructed in the project guidelines.

For detailed use case diagrams go to Project_Information folder and open UseCase Diagram.pdf and the documentation file.

For testing results go to the Testing folder. All Swagger testing screenshots are available as PNG images because development was done on Linux.

Smoke testing, functional testing, and integration testing were performed. Please check GitHub repository or the project ZIP for full demonstration.

If a complete A to Z explanation of the project is required, a detailed report is also available in the GitHub repository and project ZIP.
